

ABSTRACT OF THE DISCLOSURE

A suture anchor is provided having a body with at least one suture-receiving channel that extends distally from a proximal end of the body. The suture-receiving channel can include a cavity formed in a distal-most end of the body, or it can terminate at a transversely-extending bore formed through the body. The suture anchor can also include a suture loop that is positioned within the suture-receiving channel and cavity or bore, and that includes a proximal portion that extends proximal of the proximal end of the body.
